

SEARCHING FOR OTHER EARTHS
Craig O'Neill, Macquarie University

Earth is unique within the solar system in both having plate tectonics, and surface conditions favorable to life. Here we look at what it takes to make a habitable planet, and why Earth and Venus - two very similar planets in both size and composition - evolved down such very different paths. We also look at the diversity of exosolar planets, and what exactly it takes to make a habitable planet around distant stars.
